A Corny History

Corn has been grown in North, Central and South America for thousands of years, and it was a staple food for many Native American people groups. They shared their seed and knowledge with explorers and settlers, and corn is now grown on every continent of the world except Antarctica.

While most of the corn we see is either yellow or white, corn seeds can be many different colors. Many of us enjoy sweet corn as a vegetable, but corn is technically a grain food. Sweet corn is harvested while the kernels are still very moist inside. You might also be surprised to learn that sweet corn represents just 1% of all the corn grown in the U.S.

For cereals, baked goods and snack foods, we can mill the dried kernels of field corn, also known as dent corn, into a meal or flour.

Corn is also a favorite feed ingredient for livestock diets because it provides energy and it tastes good.

Did you know that a box of corn flakes contains less than 10 cents worth of corn? Most of the cost for processed food comes from energy, labor and marketing.

A bushel is a measure for crops equal to 8 gallons. 1 bushel of corn weighs 56 pounds.

CORN is A MAIZE ING
The history, science & use of America’s top crop

This is an ear of yellow dent corn, also known as field corn. This type of corn is used for livestock feed, food, fuel and many other items we use everyday.

Oh, How it Grows!

It takes a corn plant between 3 and 4 months to grow and mature. Most field corn is planted in the spring and harvested in the fall. The number and quality of new seeds produced on the plant depends upon the weather, availability of nutrients, pests and disease. Farmers try their best to keep the corn plants as healthy as possible.

A combine harvests the corn. Tractors, airplanes, planters, wagons and other large equipment are used to produce and deliver the corn.

A modern corn plant typically produces one ear, which may contain 600 seeds or more.

Following harvest, many farmers leave the stalks and cobs on the soil to increase organic matter and improve soil structure.

Where it Goes

Since most of the corn is grown in the Midwest, it may be shipped by truck, train or barge to other states and around the world.

The corn farmers in the U.S. are the most productive in the world. The states with stars represent where most of the corn is grown.

This publication was provided by Minnesota’s corn farmers. To learn more, visit www.mncorn.org or call 952-233-0333.

We know how to spell “amazing,” but MAIZE is another name for CORN.
